

Market Analysis for the Opening of Specialized Weightlifting Centers

Content

1. Context
2. Analysis
3. Conclusions and Recommendation

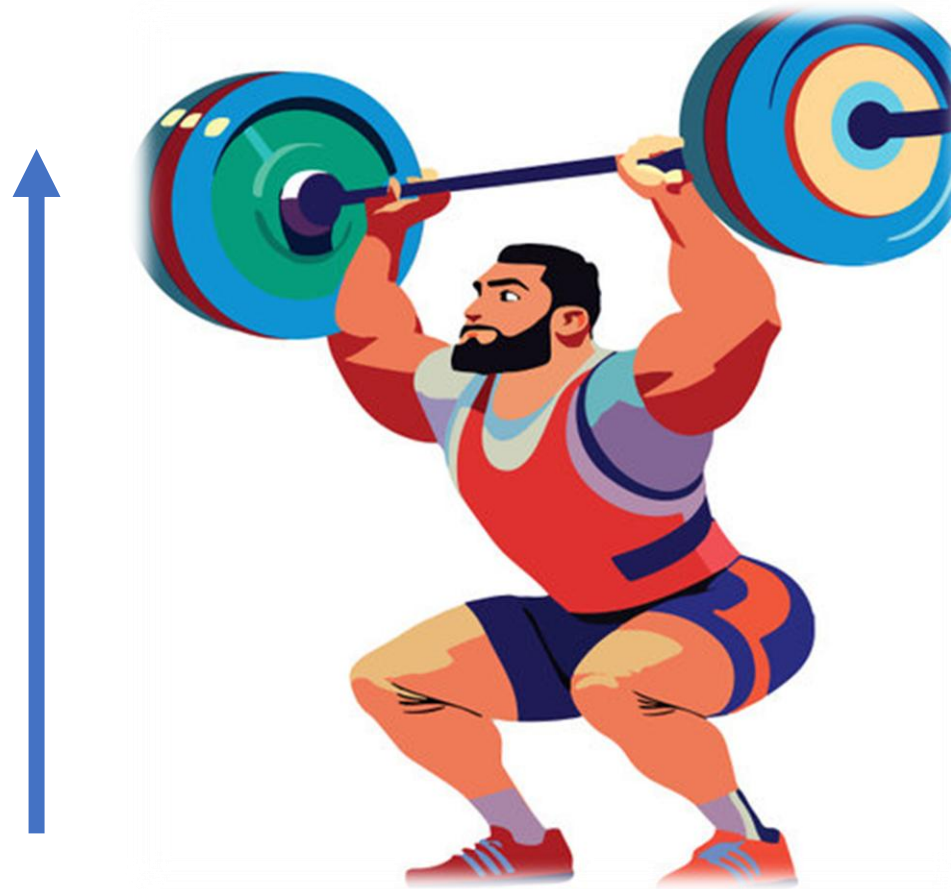

Data Source for the Analysis

The analysis is based on data scraped from Wikipedia, specifically from the Spanish editions of the following articles:

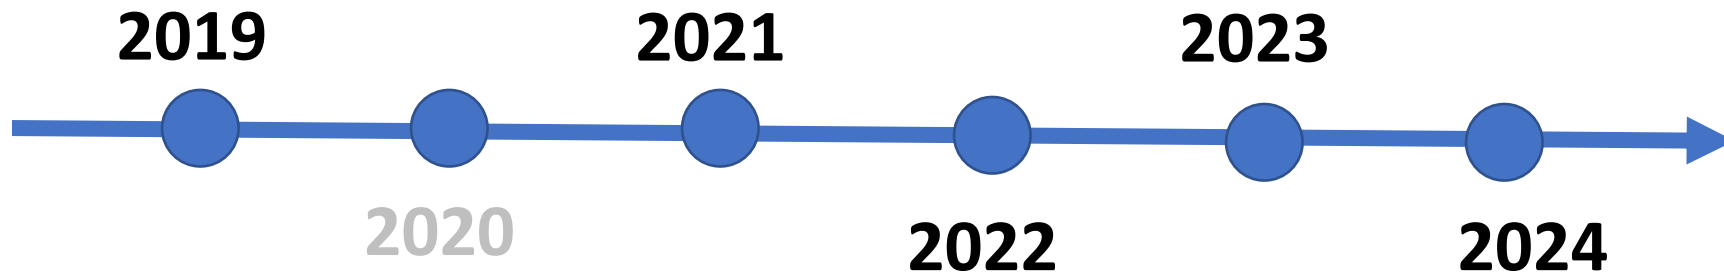

- [2019 European Weightlifting Championships](#)
- [2021 European Weightlifting Championships](#)
- [2022 European Weightlifting Championships](#)
- [2023 European Weightlifting Championships](#)
- [2024 European Weightlifting Championships](#)

The rise of CrossFit has fuelled interest in weightlifting, opening up new opportunities for specialist training centres.
Lift & Lead is looking to assess this trend before investing in its expansion across Europe.

For this reason, we will analyse the results of the European Weightlifting Championships between 2019 and 2024. This study will enable us to identify trends, assess the growth of the sport and guide **Lift & Lead's** strategy for opening its centres.

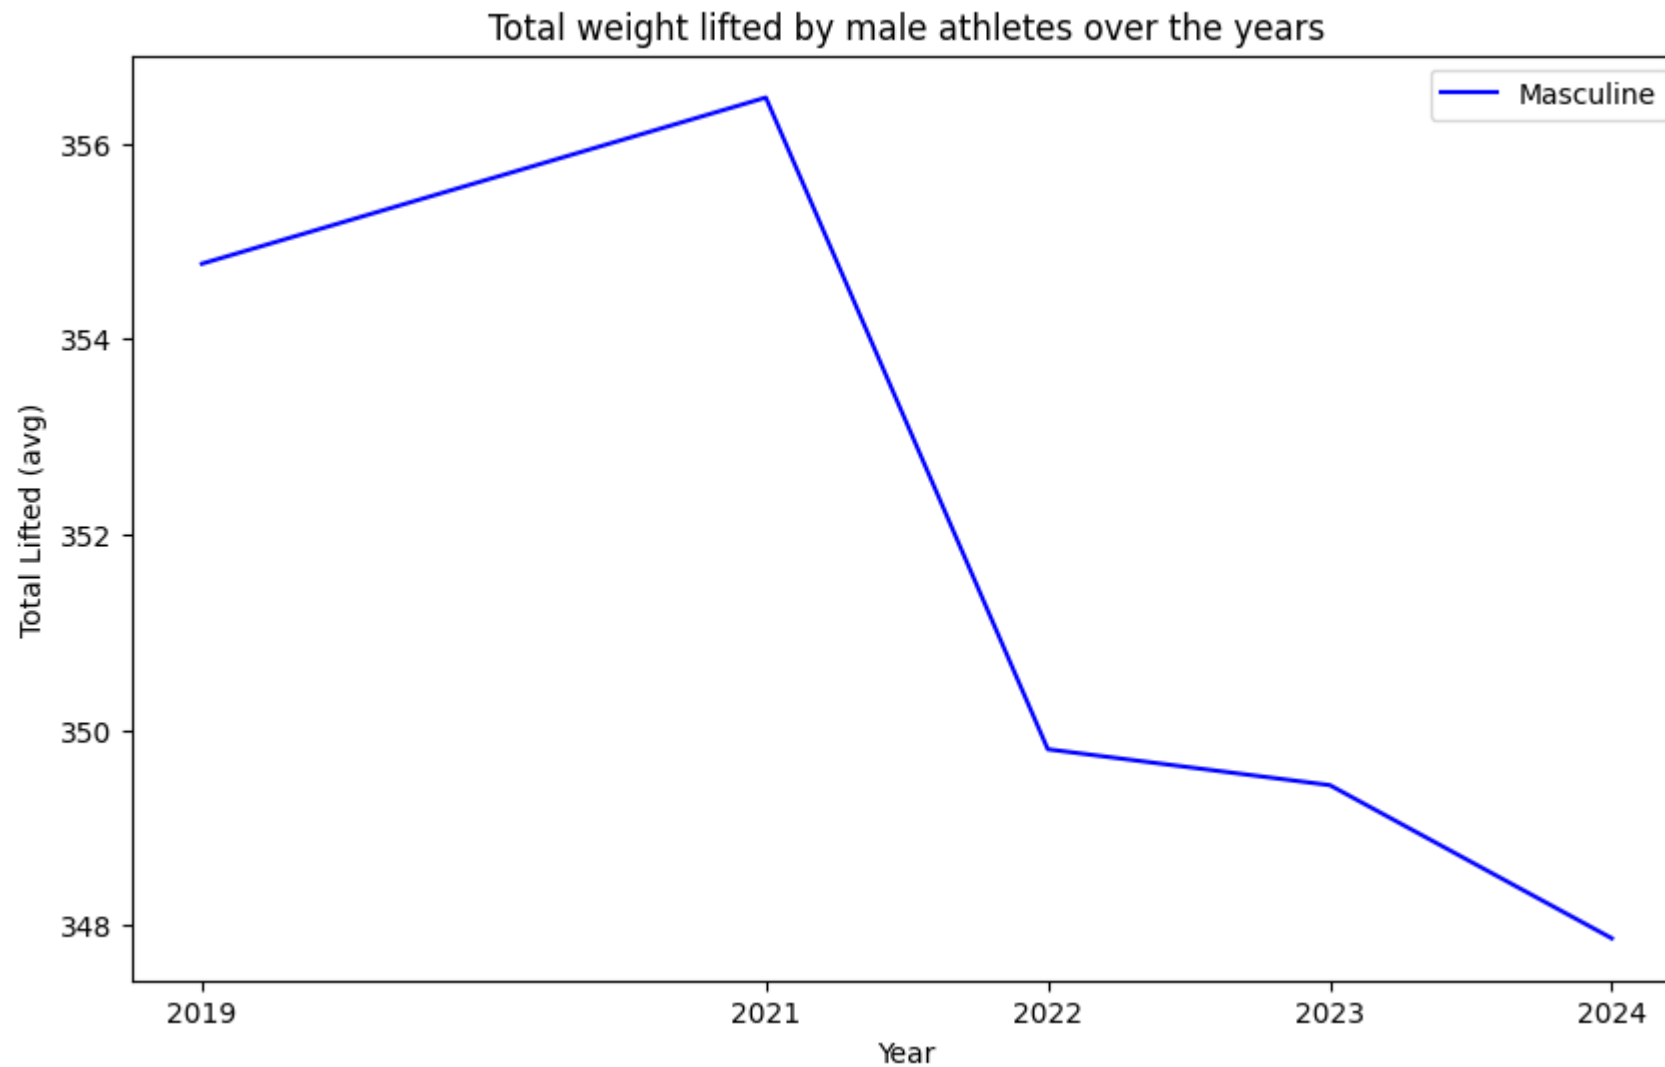

The year 2020 is excluded from the analysis, as the European Weightlifting Championships were not held due to the pandemic.

Analysis

A total of 27 countries were analysed over five years of competitions across 18 categories (for both genders) to confirm the hypothesis that the popularity of CrossFit is driving interest in weightlifting in Europe.

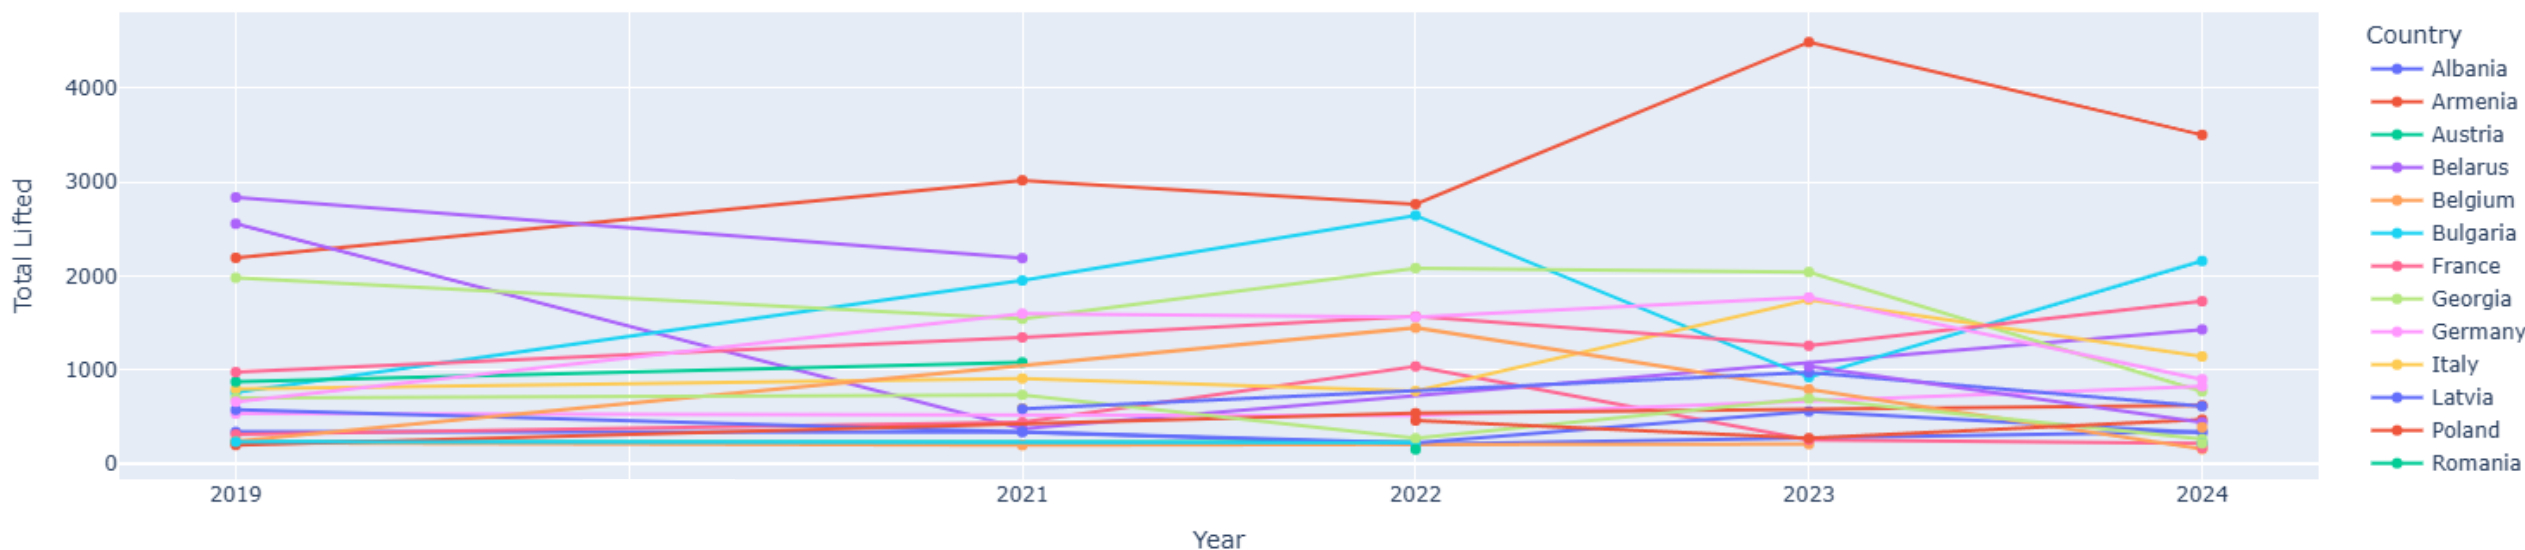

The chart 'Total weight lifted by male athletes over the years' shows a steady decline in the total weight lifted from 2021 onwards.

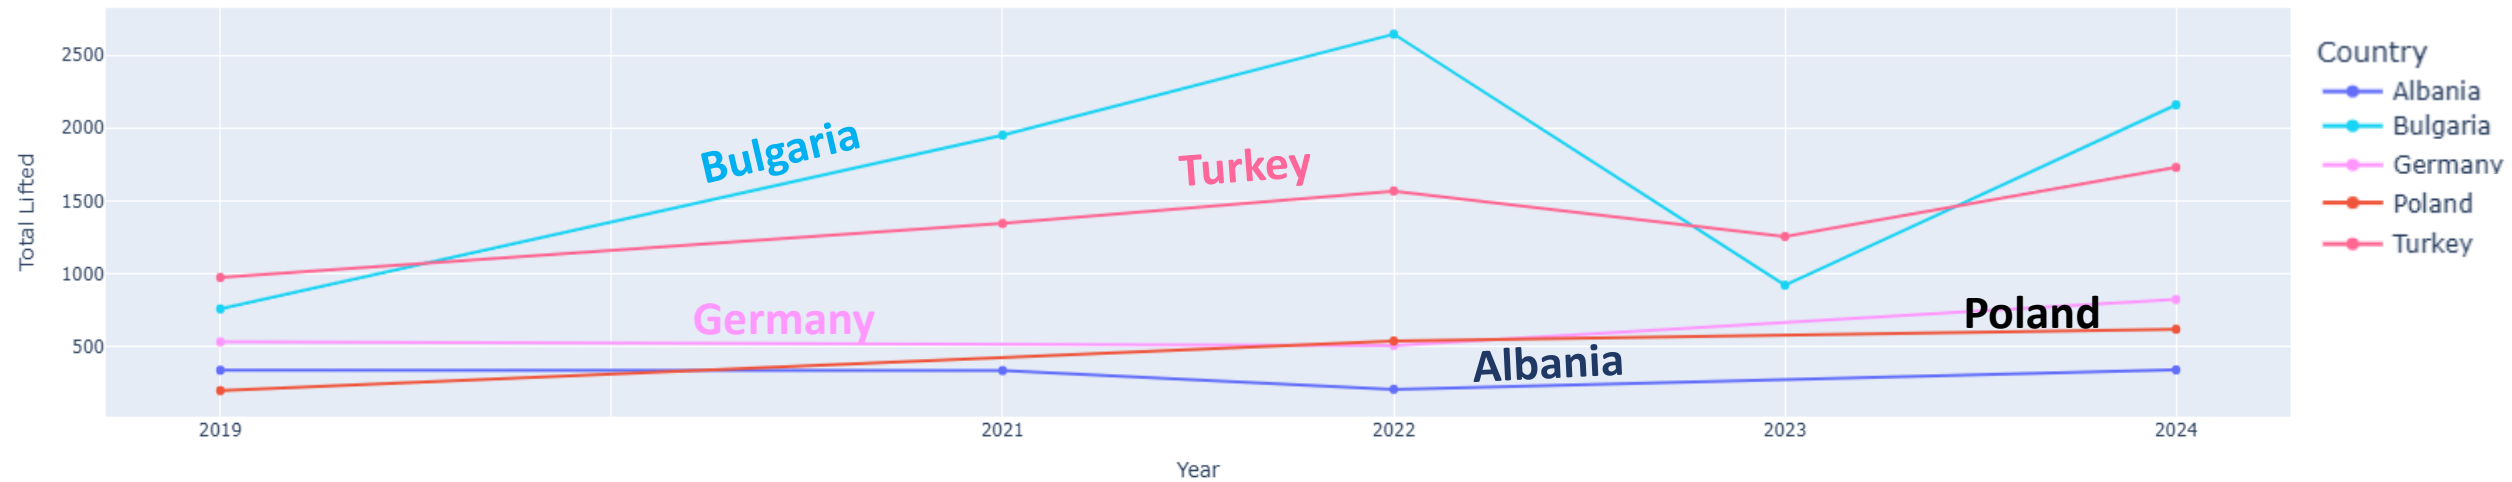

The chart 'Total weight lifted by female athletes over the years' shows a decrease in the total weight lifted between 2021 and 2022, followed by a significant increase between 2022 and 2023, and subsequently a fall between 2023 and 2024.

**The graph shows different trends across various countries.
Due to its density, we are going to analyse separately those countries where the
total amount raised has fallen and those where it has risen.**

Total Amount Lifted by Country Over the Years

Total Amount Lifted by Country Over the Years

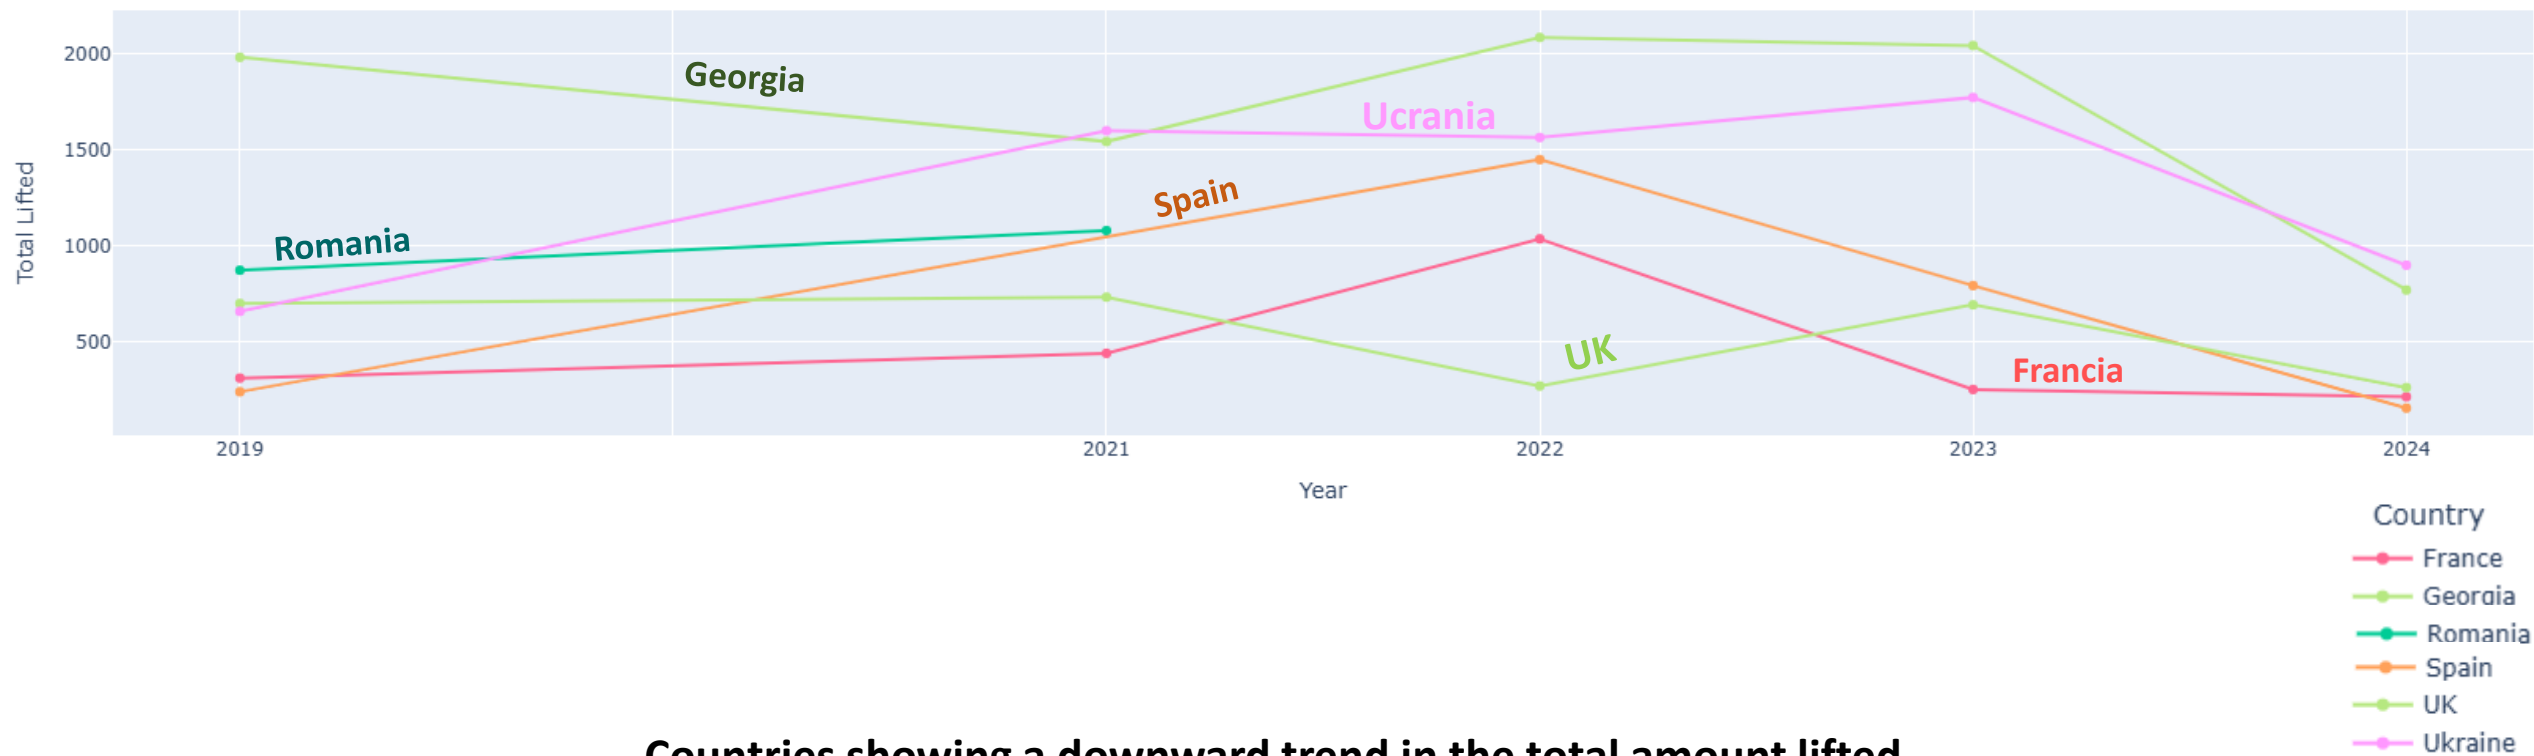

Countries showing an upward trend in the total amount raised.

In the case of Bulgaria, the increase is significant between 2023 and 2024.

In case of Turkey, Poland and Germany we can see an overall improvement between 2019 and 2024.

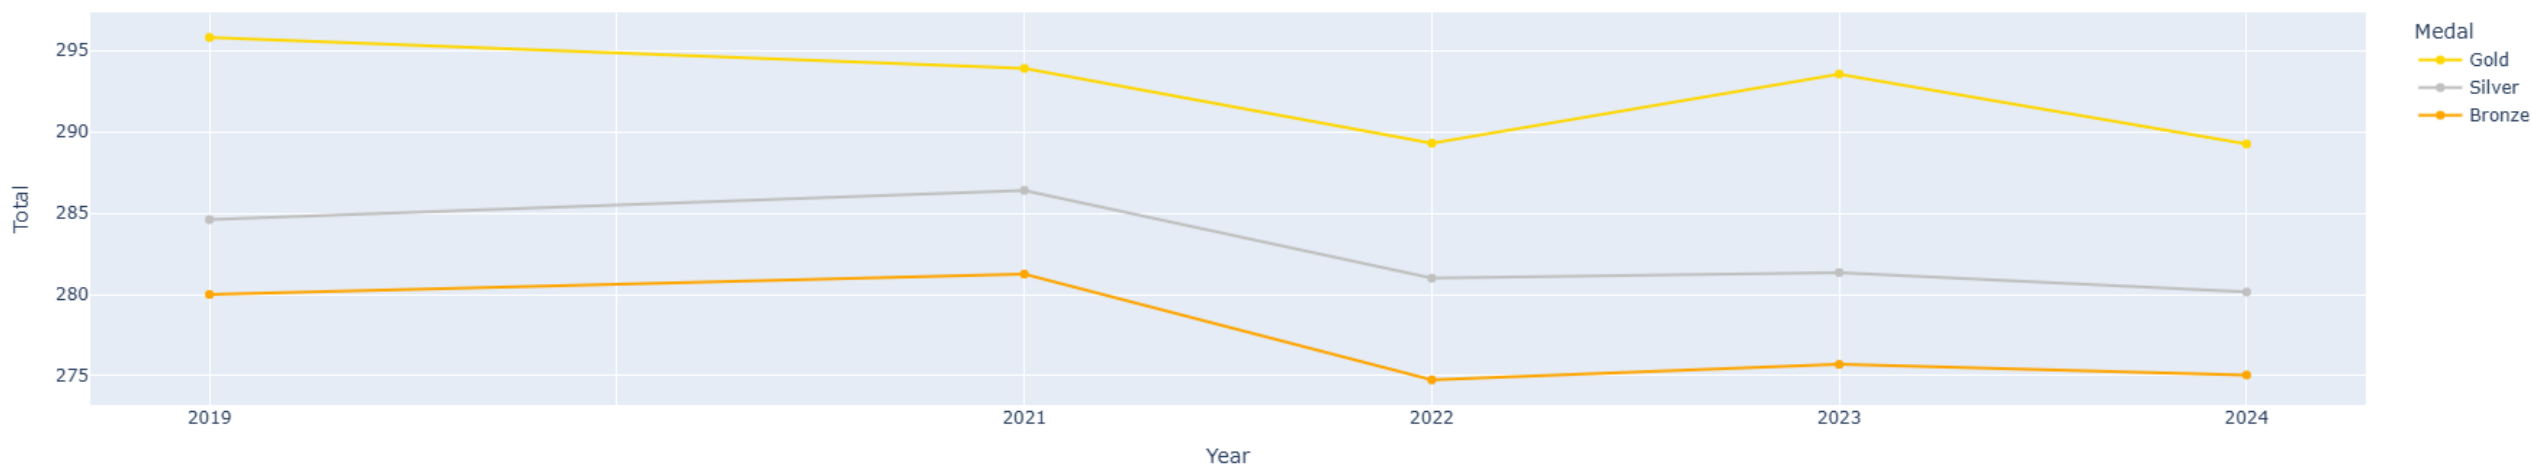

Albania shows a slight upward trend between 2022 and 2024.

Total Amount Lifted by Country Over the Years

**Countries showing a downward trend in the total amount lifted.
In the case of Georgia, Ukraine and the United Kingdom, the decline is particularly marked
between 2023 and 2024.**

Total Lifted per Medal Over the Years

This graph illustrates the evolution of the average total weight lifted (in kg) for Gold, Silver, and Bronze medalists from 2019 to 2024.

Conclusions

The analysis shows an overall decline in the total kilograms lifted between 2019 and 2024. This trend is consistent among both men and women, as well as across different countries.

This suggests that, despite the growing popularity of sports such as CrossFit, interest in weightlifting – in terms of performance measured at championships – may not be increasing, at least not during this period.

This would suggest that, were specialised centres to be opened, they might not generate the expected profits.

Recommendations

Although there has been an overall decline in the total weight lifted, some countries show different trends. There has been a slight increase in the total weight lifted during the 2019–2024 period, particularly in Poland, Turkey and Bulgaria, with the latter showing a notable increase between 2023 and 2024.

In this context, the opening of training centres specialising in weightlifting could generate a slightly more interest in these countries.

Recommendations and future analysis

Despite CrossFit's popularity in Europe, the evidence regarding its impact on weightlifting championships is mixed. CrossFit may be contributing to increased participation in strength-based activities, but it is not necessarily driving improvements in performance in high-level competitive weightlifting.

This means that a fall in the total weight lifted between 2019 and 2024 does not necessarily imply that interest amongst non-professional athletes is waning. It would be interesting to broaden the analysis to include non-professional athletes and gauge their interest in weightlifting.
